BULLETIN HX15

INTRODUCTION

Hi-Ex Series of Roof Ventilators

A continuing demand exists in commercial and industrial buildings for high velocity roof ventilators which exhaust foul air and disperse it high above the roof. The Hi-Ex is ideal for the "spot" ventilation of specific problem areas where rapid air removal is necessary or for general plant ventilation. This "plug-in" or package ventilation is easily installed out of the way, up on the roof. It is accessible and yet does not use valuable interior areas nor does it require costly duct systems.

Dampers open automatically when the fan is started. The airstream holds the dampers open and excludes weather until the power is shut off. Then, the dampers automatically close tight as the air blast diminishes.

The direct drive Hi-Ex illustrated above-left is a solid, compact unit completely self-contained. The standard silhouette is streamlined and the straight-thru air blast provides rapid, friction-free, air removal. Note the components are all within the housing. They do not intrude, nor protrude, below the roof line. Two types of belt drive fans are available. One with the motor out of the airstream and the other with the motor inside the ventilator air shaft. Both arrangements permit capacity selections at fan speeds other than standard motor speeds. They enable the adjustment of air volumes on the job if necessary. Your fan schedule specification should indicate "remote drive" if desired.

Standard Height Units

Model: HC - Cast Aluminum Propeller

- Static pressure up to 1.0" wg.
- Direct Drive - Flow capacity up to 33,000 CFM
- Belt Drive - Flow capacity up to 70,000 CFM

Model: HX - Cast Aluminum Propeller

- Static pressure up to 0.75" wg.
- Direct Drive - Flow capacity up to 38,000 CFM
- Belt Drive - Flow capacity up to 33,000 CFM

Model: HF - Fabricated Steel Propeller

- Static pressure up to 0.5" wg.
- Belt Drive - Flow capacity up to 51,000 CFM

HiteSaver Units

Model: HZ - Cast Aluminum Propeller

- Static pressure up to 0.75" wg.
- Direct Drive - Flow capacity up to 45,000 CFM
- Belt Drive - Flow capacity up to 82,000 CFM

Model: HS Fabricated Steel Propeller

- Static pressure up to 0.5" wg.
- Belt Drive - Flow capacity up to 50,000 CFM

Heat & Smoke Units

Model: HS - With Heat & Smoke Exhaust Option

- Fabricated steel propeller
- Static pressure up to 0.5" wg.
- Remote Belt Drive - Flow capacity up to 50,000 CFM

CERTIFICATIONS & LISTINGS

AMCA Certification

PennBarry certifies that models HS 30–48 roof exhausters on page 13 are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and Publication 311 and comply with the requirements of the AMCA Certified Ratings Program.

UL and cUL Certification

Hi-Ex exhausters (models HC, HF, and HS) carry the UL label, UL705 (ZACT/ZACT7), file #E28413. Model HS with heat and smoke option carries the UL label, UL793 (ZAXH/ZAXH7), file #MH19473.

FEATURES & BENEFITS

Fan Blades

The design of fan blades has been very carefully determined to insure highly efficient performance. Cast aluminum, airfoil, or die-formed high capacity steel fan blades provide the flexibility required to achieve most fan performance ratings. Spark resistant fans use blades cast of high tensile strength aluminum alloy. Versatility is accomplished through the use of four and six blade fans which exhaust an even flow. All blades are balanced to run properly.

Venturi Inlet

Combined with a heavy gauge base is a one-piece, leakproof, spun and streamlined venturi inlet to minimize entrance losses and noise.

Gun Barrel Design

Straight-thru air blast, minimal stack obstructions and absence of caps assure full fan capacity and prevent re-entry of exhausted air through adjacent fresh air intakes or windows. Contaminated air does not damage roof surfaces.

Weather Resistant Operation

Air blast turns back rain and snow, and provides an air curtain to keep out the elements. Full size windband protects the dampers while open.

Simplified Construction

HI-EX fans require little maintenance. They are ruggedly built of heavy metal, securely welded and thoroughly reinforced with beading and angle rings. When properly installed, they will withstand high winds. Flutter guards are standard with the HI-EX and provide extra protection against damper flutter due to pressure difference.

Damper Assembly

The damper assembly consists of a number of components and features:

- Dampers automatically overlap the air shaft to prevent heat losses and backdrafts.
- Damper bearings: The trouble-free damper bearing assembly provides long wearing surfaces at the pivot points.
- Damper Shafts: Mounted in oil-less brass or nylon bearings allowing the assembly to operate freely without binding and require no further attention or lubrication.
- Drainage Trough: Centrally located to allow water to run off as required.
- Easily Removable: The complete damper assembly is easily removable to gain access to the internal fan components, if required.
- End Pivot Damper Arrangement: The design of the end pivot damper arrangement utilizes the full force of the fan at the blade tips. This maximizes lift, employs the complete working area of the blades, and eliminates dead spots at the center of the hub of the fan.
- Rubber Gasketing: Fitted around the air shaft to help seal the damper opening and also to eliminate noise upon closure.
- Rubber Stops: Used to prevent the dampers from locking in the open position, rubber stops are installed on the upper wind band support.

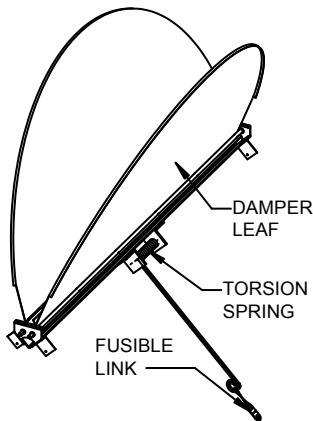

OPTIONS & ACCESSORIES

Fire and Smoke Damper (HS Only)

Optional fire and smoke damper provision enables dampers to automatically open in a fire emergency. A sturdy steel, high torsion, special alloy spring arrangement, retained by a heat sensitive fusible link, can be incorporated to provide this protection. This action is independent of fan operation and is activated by UL listed links with pre-determined melting points.

This feature has been widely employed in industrial plant ventilation to permit the escape of noxious, blinding smoke as well as super-heated air and the gases present during a fire. It is recommended by insurance underwriting authorities and safety officials.

Fan Guards

Since Hi-Ex fans contain rotating parts, PennBarry recommends the following safety precautions be taken during installation, operation, and maintenance. Install fan guards on all nonducted fan installations to protect people working around the fan from accidental falling debris and to protect the fan from foreign objects coming into contact with moving parts. Inlet fan guards for HiteSaver models HS and HZ must be fabricated locally. For proper and safe operation, fan RPM should not exceed that recommended in performance tables. Installations that result in excessive vibration are unacceptable. Designers should urge contractors to refer to operation, maintenance, and instruction manuals for proper and acceptable levels of vibration.

Safety Disconnect Switches

UL listed, non-fused, safety disconnect switches can be provided to match system electrical characteristics. These can be furnished in a weatherproof enclosure specifically designed for outdoor installation; or, under the motor weather cover in remote drive belted units. Disconnect switches are to be field wired by a licensed electrician.

Latches

For areas of high wind and interior positive pressure, magnetic latches and/or air activated positive locking latches are also available for factory or field mounting. These latches help to minimize flutter and keep dampers closed when the fan is not in operation.

Finishes

Coatings such as air dry enamel, epoxy, or heresite are available upon request. See the coatings brochure for details.

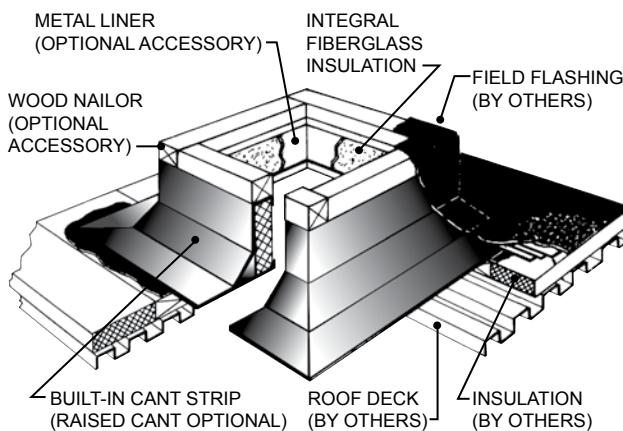

Helper Springs

When extra assistance is required to open dampers under low velocity conditions, helper springs are available. They are recommended for applications where the throat velocity is under 1300 FPM and where the low speed of a two speed motor will be used.

Roof Curbs

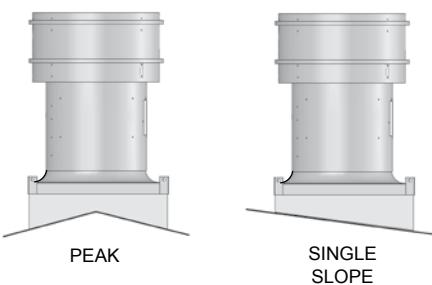

Roof curbs are furnished in a variety of types from canted or self-flashing to sloped or flat pitch. Standard construction includes galvanized or aluminum material, insulation, and metal, rubber gasketing or wooden nailing mounting surface. See the Roof Curbs brochure for details.

Illustrated below is the Unibeam Curb, which is most generally used with Hi-Ex vertical discharge ventilators. Costs of this device are normally less than field built curbs. The Unibeam Curb shown is for flat roof installation.

Peaked or Sloped Curbs

Whether the installation is on the peak or a single slope of the building, the Unibeam Curb will accommodate the application. Each curb is custom built to meet the needs of the project.

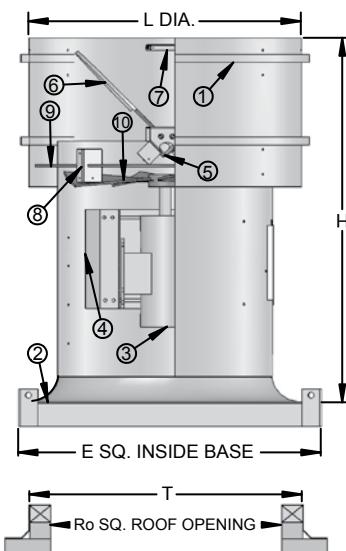

HC, HX, HF | STANDARD HEIGHT

HI-EX ventilators are available in three standard drive arrangements. Direct drive fans have blades on the motor shaft. Belt drive units are available for general ventilation conditions where the motor and drive components are installed within the ventilator air shaft to take advantage of airstream cooling action. The exhausting air washes the motor and bearings, increasing longevity of these components.

In applications where heat or dirt laden air is being removed, belt drive units can be furnished with the motor installed outside the air shaft, under a separate weather cover. In extremely corrosive applications the fan bearings, belts and fan shaft can be encased in a protective housing.

Direct Drive

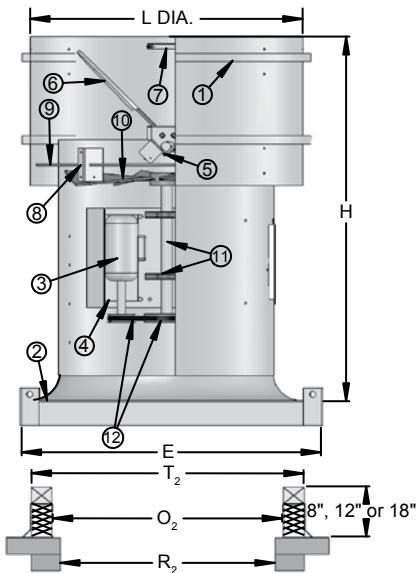

Shown on Field Built Curb.

1. Protective Windband and Stiffening Beads
2. Spun Venturi and Mounting Base
3. Ball Bearing Motor
4. Drive Support Assembly
5. Drainage Gutter

Belt Drive

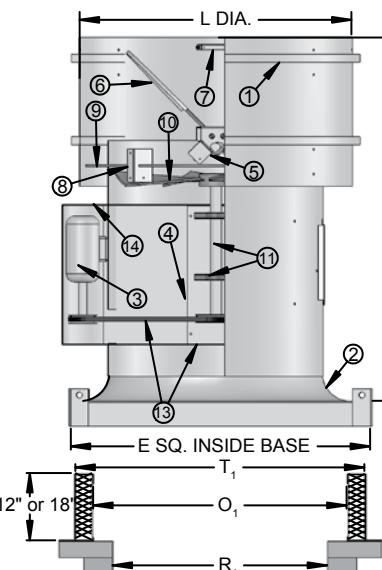

Shown on Unibeam Curb.

6. Butterfly Damper Assembly
7. Damper Stop-Rubber Cushioned
8. Supporting Brackets
9. Flutter Guards
10. Axial Impeller
11. Fan Shaft and Bearings (Belt Drive)
12. Belt and Pulleys
13. Belt and Bearing Enclosures with Air Guide (Optional)
14. Motor Weather Cover

Remote Drive

Shown on Self Flashing Curb.

11. Fan Shaft and Bearings (Belt Drive)
12. Belt and Pulleys
13. Belt and Bearing Enclosures with Air Guide (Optional)
14. Motor Weather Cover

All dimensions in inches. *First gauges are for mounting bases. Second gauges are for windbands and air shafts. Although mounting base dimensions are standard, adapters and modifications are available when needed. Ask for certified dimension drawings before proceeding since dimensions do change.

HZ | HITESAVER (LOW PROFILE)

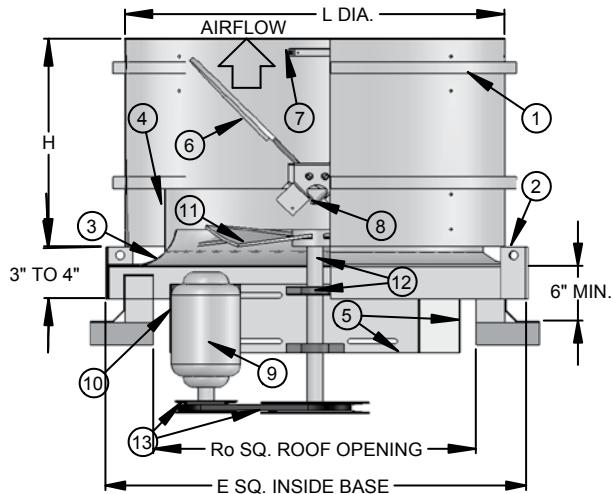

For applications where height is a consideration, PennBarry offers the HiteSaver, Model HZ. The HiteSaver features an extra-low profile. The propeller, motor and drive are recessed into the roof opening and extend below the roof line. This design provides for convenient access from the building interior when structural members provide clearance.

The windband is constructed of galvanized steel and contains two reinforcing ribs. This assembly is supported by the curb base and steel brackets. The curb base is all-welded heavy gauge galvanized steel with a deep spun venturi to smooth airflow. External bracing provides extra rigidity. Integral lifting lugs are included.

Direct Drive

1. Protective Windband (Ribbed Reinforced)
2. Curb Base with Lifting Lugs
3. Venturi-type Orifice
4. Throat with Top Gasket
5. Welded Steel Internal Bracing

6. Butterfly Damper Assembly
7. Damper Stop—Rubber Cushioned
8. Rain Channel and Damper Bearings
9. Ball Bearing Motor
10. Motor Mounting Plate

Belt Drive

11. Propeller (Cast Aluminum Airfoil)
12. Fan Shaft and Bearings (Belt Drive)
13. Belt and Pulleys (Belt Drive)

HS | HITESAVER (LOW PROFILE)

For applications where height is a consideration, PennBarry also offers the HiteSaver, Model HS. The HiteSaver features an extra-low profile. The propeller, motor, and drive are recessed into the roof opening and extend below the roof line. This design provides for convenient access from the building interior when structural members provide clearance.

The windband is constructed of galvanized steel and contains two reinforcing ribs. This assembly is supported by the curb base and steel brackets. The curb base is all-welded heavy gauge galvanized steel with a deep spun venturi to smooth airflow. External bracing provides extra rigidity. Integral lifting lugs are included.

HS | HITESAVER, HEAT & SMOKE EXHAUST PACKAGE

- 1000°F for minimum 15 minutes (SBCCI "Standard Fire Prevention Code")
- 500°F for 4 hours (IRI Requirement)
- UL listed "Power Ventilators for Smoke Control Systems", which includes UL 705 "Power Ventilators" and UL793 "Automatically Operated Roof Vents for Smoke and Heat". This testing includes Snow Load, Dust Load, and Cycling Tests for butterfly dampers.

While these fans are commonly used for general ventilation, when equipped with Heat and Smoke option, this series of fans incorporates features exclusively designed to exhaust heat and smoke in the event of fire. During these emergencies, the fans are designed to operate at the temperature and minimum time limits stated. To maintain power to these fans during emergencies, special consideration must be made for field power supply. In the event that power is disrupted, fusible links melt when the temperature exceeds 165°F, at which point the unit functions as a gravity exhaust ventilator. In the event of an emergency, if power is maintained, the units will operate for the minimum times and temperatures indicated, after which they will continue to operate until they are destroyed by the extreme temperature generated during an actual fire, or the roof structure collapses.

Aspirated Belt and Bearing Cover

Shields critical drive components from high temperature airstream. Cool ambient air is drawn through the enclosure to maintain temperature during emergency operation.

Vented and Aspirated Motor Compartment

Cool ambient air is drawn through the motor compartment to assure temperature around the motor does not exceed safe limits.

Two Groove Pulleys

Sized for minimum 200% of installed horsepower, each belt is capable of handling the complete load. This provides maximum reliability and safety.

Galvanized Steel Damper Blades

Provide higher temperature resistance and better durability than aluminum blades used for exclusive general ventilation applications.

Service Access Panel

Allows access to bearings and belts for routine inspection and maintenance when fans are used for general ventilation. Regular inspection and maintenance helps assure that Heat and Smoke exhaust fans operate as intended when emergency smoke removal is required.

1. Protective Windband (Ribbed Reinforced)
2. Curb Base
3. Venturi-type Orifice
4. Throat with Top Gasket
5. Welded Steel Internal Bracing
6. Butterfly Damper Assembly
7. Damper-Stop Rubber Cushioned
8. Rain Channel & Damper Bearings
9. Ball Bearing Motor
10. Motor Mounting Plate
11. Propeller (Fabricated Steel)
12. Fan Shaft & Bearings
13. Belt & Pulleys (Double Groove Min. High Temperature Belts)
14. Motor Weather Cover (Remote Drive)
15. Belt & Bearing Breather Duct Enclosure
16. Torsion Springs & Fusible Links - 165°F
17. Extended Grease Lines & Fittings (Optional)
18. Disconnect Switch - (Optional Remote Outside Mount)

Power rating BHP does not include transmission losses. Performance certified is for installation type A – Free inlet, Free outlet. Performance ratings do not include the effects of appurtenances. The sound ratings shown are loudness values in fan sones at 1.5 m (5 ft) in a hemispherical free field calculated per AMCA International Standard 301. Values shown are for: Installation Type A: free inlet hemispherical sone levels. Explosion proof motors and disconnects are available when specified.

Power rating BHP does not include transmission losses. Performance certified is for installation type A – Free inlet, Free outlet. Performance ratings do not include the effects of appurtenances. The sound ratings shown are loudness values in fan sones at 1.5 m (5 ft) in a hemispherical free field calculated per AMCA International Standard 301. Values shown are for: Installation Type A: free inlet hemispherical sone levels. Explosion proof motors and disconnects are available when specified.

ENGINEERING SPECIFICATIONS

HC - Direct Drive Units

Direct Drive Axial Upblast Roof exhaust fan shall be Hi-Ex HC, manufactured by PennBarry.

Units shall be weather resistant and designed to withstand prevailing wind velocities. A heavy gauge galvanized motor mounting panel shall be securely fastened to heavy gauge galvanized air shaft. Air shaft shall be welded to a heavy gauge galvanized base with welded corners, pre-punched mounting holes, and a deeply spun venturi. A ribbed reinforced galvanized windband shall be securely fastened to air shaft and shall include automatic butterfly dampers which open and close with the start and stop of the fan. No portion of fan shall protrude below the roof line.

Statically and dynamically balanced propellers shall be cast aluminum and airfoil shaped. Motors shall be continuous duty, ball bearing design, positively cooled, and furnished at the specified voltage and phase.

HC - Belt Drive Units

Belt Drive Axial Upblast Roof exhaust fan shall be Hi-Ex HC, manufactured by PennBarry.

Units shall be weather resistant and designed to withstand prevailing wind velocities. A heavy gauge galvanized motor mounting panel shall be securely fastened to heavy gauge galvanized air shaft. Air shaft shall be welded to a heavy gauge galvanized base with welded corners, pre-punched mounting holes, and a deeply spun venturi. A ribbed reinforced galvanized windband shall be securely fastened to air shaft and shall include automatic butterfly dampers which open and close with the start and stop of the fan. No portion of fan shall protrude below the roof line.

Statically and dynamically balanced propellers shall be cast aluminum and airfoil shaped. Motors shall be continuous duty, ball bearing design, positively cooled, and furnished at the specified voltage, phase, and enclosure. Shafts shall be turned, ground, polished, and rust protected. Pulleys shall be adjustable, cast iron, machined, keyed, securely attached, and sized for 150% of the horsepower at its rated maximum speed.

HX - Direct Drive Units

Direct Drive Axial Upblast Roof exhaust fan shall be Hi-Ex HX, manufactured by PennBarry.

Units shall be weather resistant and designed to withstand prevailing wind velocities. A heavy gauge galvanized motor mounting panel shall be securely fastened to heavy gauge galvanized air shaft. Air shaft shall be welded to a heavy gauge galvanized base with welded corners, pre-punched mounting holes, and a deeply spun venturi. A ribbed reinforced galvanized windband shall be securely fastened to air shaft and shall include automatic butterfly dampers which open and close with the start and stop of the fan. No portion of fan shall protrude below the roof line.

Statically and dynamically balanced propellers shall be cast aluminum and airfoil shaped. Motors shall be continuous duty, ball bearing design, positively cooled, and furnished at the specified voltage and phase.
